Thanks a lot, a Bisham 1 GB 12 k1 darulkitab islam ansiklopedisi v3 116 Search, free download.Q: Expand a parent element dynamically based on the item clicked on a fixed-position-list We have a fixed position navigation that's working as expected. It has a parent element that is the container of the navigation that also has a sub-element. When we click on a list item, that parent element needs to expand and show the sub element within. What we've accomplished is the list item is expanding and removing the original sub-element. But the issue is that the sub-element is hiding behind the parent element. So what we've really done is the entire sub-element is being removed and replaced with nothing. We want to bring it back, but only in the area where the sub-element was initially. Please see the code snippet below for further explanation: \$(document).ready(function() { \$(' .top-list-item').on('click', function(e) { e.preventDefault(); \$(this).toggleClass('top-list-item-active'); \$(' #sub-item').slideToggle('quick'); }); }); .bottom-bar { position: fixed; bottom: 30px; display: block; } #sub-item { display: none; position: absolute; bottom: 10px; right: 10px; width: 290px; } .top-list-item-active #sub-item { display: block; } Item 1 Item 2 55cdc1ed1c
